TM14 is a new member of the fibulin family fibulin-7 that interacts with extracellular matrix molecules and is active for cell binding. In the present work, using a yeast two-hybrid screening, we have found that fibulin-2 is a new partner of the ADAMTS metalloprotease. Cells that reached the lower surface were stained with crystal violet.

JordiSierraiFabra. To assess the effect of ADAMTS and fibulin-2 on breast cancer prognosis, survival probability was determined using the data available at www. For instance, thrombospondin type-1 motifs at carboxy-terminal region of the protease influence its antimetastatic potential. Overall, these results indicate that fibulin-2 and ADAMTS affect ability of breast cancer cells to form mammospheres.

Identificationofthepreyinsertswasperformedbydirectsequencing. Besi underlying these effects are not yet known, but association with other ECM components could also influence pro-tumor or anti-tumor activities of fibulins.
